

What is claimed is:

1. A positioning structure comprising:

a main member;

a boss upstanding from the main member, the boss having a positioning section; and

a plurality of members to be pierced each having a through hole through which the boss is inserted whereby the members to be pierced are stacked and fixed and the main member and the members to be pierced are relatively positioned to each other,

wherein the positioning section positions the members to be pierced to predetermined positions along an inserting direction of the boss, respectively.

2. The positioning structure according to claim 1, wherein the positioning section is configured by a plurality of steps which are disposed by forming the boss into a shape that is stepwise tapered as advancing toward a tip end.

3. The positioning structure according to claim 2, wherein, with respect to a width of each of the steps of the boss perpendicular to the inserting direction, minimum inner dimensions of the through holes of the members to be pierced correspond to placement positions of the members to be pierced, respectively.

4. The positioning structure according to claim 2, wherein gap dimensions between the steps in the inserting direction correspond to thickness of the members to be pierced, respectively.

5. The positioning structure according to claim 1, wherein the boss is formed into a shape that is continuously tapered as advancing toward a tip end, and, with respect to a width of the boss perpendicular to the inserting direction, minimum inner dimensions of the through holes of the members to be pierced correspond to placement positions of the members to be pierced, respectively.
